DIGITAL LITERACY PROJECT REPORT

Title Page

Name: Akshita Girdhar
Registration Number: 25BET10002
Branch: B.Tech CSE
Year: 1st Year
Course Code: CSE0001
Course Name: Digital Literacy

Introduction

Digital literacy means having the knowledge and ability to use digital technology in a safe, smart, and effective way. In today's world, students depend on digital platforms for studying, communication, and skill development. Because of this reason, it is very important for every student to understand how to use digital tools properly.

This project was designed to help us understand practical digital skills instead of only theoretical knowledge. Through this project, I learned how to create a professional online presence, how to use coding platforms, how to communicate professionally through email, and how to stay safe from cyber threats.

Before this project, I was only using digital platforms for entertainment and basic study purposes. After completing this project, I understood how these platforms can help in career building and skill development. I also understood that using technology responsibly is very important because misuse can create problems like cybercrime or digital reputation damage.

This project also helped me become more confident in exploring new platforms. Earlier I hesitated to create professional profiles, but now I feel comfortable using them. I believe the knowledge gained from this project will help me throughout my B.Tech journey.

Task 1 – Digital Literacy Infographic

In this task, I created a digital literacy awareness infographic using Canva. The purpose of this infographic was to explain what digital literacy means and why it is important for students.

In my design, I included information about safe internet practices, useful digital tools, and professional behaviour online. I explained how students should avoid unsafe websites, should not share personal details publicly, and should always maintain a positive online image.

While making the infographic, I explored different templates and design features available in Canva. I learned how to insert icons, change colors, and arrange text properly. At first, it was

difficult to decide which design would look best, but after experimenting, I was able to make a neat and informative design.

One interesting thing I learned is that visual learning is very effective. When information is presented with icons and short points, it becomes easier to understand compared to long paragraphs.

This task helped me improve my creativity and also taught me that awareness can be spread easily using simple visual content.

Task 2 – Student Digital Portfolio

In this task, I created accounts on GitHub, LinkedIn, and Kaggle. The purpose was to start building a professional digital portfolio from the first year itself.

On GitHub, I created my repository and learned how to upload files and edit README. This was my first experience using GitHub, so I learned many new things. I understood that GitHub is very useful for storing projects and showing technical work.

On LinkedIn, I added my education details and basic profile information. I learned that LinkedIn is important for networking and finding internship opportunities. I plan to update my profile regularly as I gain more skills and certifications.

On Kaggle, I explored datasets and beginner learning sections. Even though I am new to this platform, I understood that it will be useful when I start learning data science.

From this task, I learned that maintaining a digital portfolio is very important because companies often check online profiles. I plan to keep improving my profiles during the next four years.

Task 3 – Coding and Collaboration Platforms

For this task, I created an account on HackerRank and solved a beginner problem. This helped me understand how coding challenges are structured. Even though the problem was simple, it helped me understand the importance of logic building.

After solving the problem, I felt motivated because it gave me confidence that I can improve my coding skills with practice. I plan to regularly practice on such platforms.

In the second part, I created a Google Form containing digital literacy questions. I added multiple choice questions and one short answer question. I also saw how responses are automatically collected in Google Sheets.

This task helped me understand how useful Google tools are for collaboration. These tools can be used for surveys, quizzes, and collecting feedback.

Overall, this task helped me understand that coding improves technical ability and collaboration tools improve productivity.

Task 4 – Email Etiquette and Professional Communication

In this task, I learned how to write professional emails. I wrote one email requesting assignment extension and another email showing interest in an internship.

While writing these emails, I learned that emails should always include:

- Clear subject line
- Proper greeting
- Short and clear message
- Professional closing

I also created a social media do's and don'ts checklist. Important points included:

Do's:

- Use respectful language
- Think before posting
- Maintain privacy settings
- Share useful information
- Build positive profile

Don'ts:

Do not share passwords
Do not post offensive content
Do not spread fake news
Do not overshare personal life
Do not argue publicly

A real problem caused by poor communication can happen when students send rude or incomplete emails. This creates a negative impression. If communication is polite and structured, it creates respect.

This task taught me that communication skills are as important as technical skills.

Task 5 – Cybercrime Awareness

In this task, I studied phishing cybercrime. Phishing is a type of fraud where attackers try to steal personal information through fake emails or messages.

Usually, attackers send messages pretending to be banks or companies. They ask users to click a link or share OTP. If the user trusts the message, their data or money can be stolen.

Students are easy targets because sometimes they are not aware of such tricks. The consequences include financial loss and data theft.

I also learned prevention steps like:

- Never sharing OTP
- Checking website URLs
- Using strong passwords
- Avoiding unknown links
- Reporting fraud immediately

I also learned that cybercrime can be reported on the National Cyber Crime Portal and helpline 1930.

What surprised me most was how simple mistakes can cause big losses. After this task, I decided to always verify links before clicking and never share personal details.

This task increased my awareness about digital safety.

Conclusion

This Digital Literacy project helped me learn many practical skills which are very important for students. Through different tasks, I learned how to use digital tools not only for study but also for career development.

I learned how to build my digital portfolio, how to communicate professionally, how to practice coding, and how to protect myself from cybercrime. These skills will help me during internships and placements.

The most important lesson I learned is that digital responsibility is very important. Technology is powerful but must be used carefully.

Overall, this project was very useful and helped me become more confident in using digital platforms. I will continue improving my skills and using these platforms for learning and growth.
